

Bandaru Rajkumar

Software Engineer — Java · Spring Boot · Microservices · RESTful APIs

b.rajkumar@inficloud.com · +91 91215 64239 · Hyderabad, Telangana · Notice period **XX days**

Cotiviti requisition 2026-20301 — Java Developer walk-in, 19 September 2026

PROFESSIONAL SUMMARY

Software engineer with **four years** at a single employer on a production telecom BSS — a Java and **Spring Boot** platform of approximately 130 Maven modules handling subscriber lifecycle, prepaid and postpaid billing, wallet and payments, and carrier integration. Hired following a **Java entrance assessment** and have since worked across the platform, including a production change through its **Java payment and wallet path**, and daily work in its **RESTful API** contracts, authentication model and MySQL data model. Independently designed and built a **16-service Spring Boot 3 / Java 21 microservices platform** — Spring Cloud Gateway, service registry, OpenFeign, JWT security, escrow payments, Testcontainers — spanning roughly 31,000 lines of Java. Strong **SQL development**, REST API design, and distributed-systems reasoning around idempotency, retry safety and multi-replica correctness. Civil engineering graduate who moved into software development and has built a career on backend and platform work since. Seeking a backend engineering role building Java services.

TECHNICAL SKILLS

Languages: Java 8, Java 21, SQL, JavaScript, TypeScript, Python (automation and tooling)

Frameworks: Spring Boot, Spring MVC, Spring Data JPA, Hibernate, Spring Security, Spring Cloud (Gateway, Netflix Eureka service discovery, Config Server), OpenFeign, JWT, Lombok, MapStruct, Node.js, Express

API and architecture: RESTful API design, microservices architecture, API gateway, service discovery, multi-tenancy, idempotency, transactional outbox, circuit breaker, scheduled and event-driven processing, OpenAPI / Swagger

Databases: MySQL — native SQL development, query performance tuning, indexing, joins, aggregation, window functions; JPA / Hibernate entity mapping and transaction management; schema design; MS SQL Server and T-SQL (working knowledge)

Testing: JUnit 5, Mockito, Spring Boot Test, MockMvc, Testcontainers

Cloud and DevOps: AWS — EC2, RDS, SQS, Secrets Manager, CodeCommit (working knowledge); Docker, Docker Compose, Nginx, Jenkins, Maven

Tools and practices: Git, Bitbucket, GitHub, Jira, Agile / Scrum, code review, Postman

Frontend: React, Next.js, Angular, RxJS (production ownership — see experience)

PROFESSIONAL EXPERIENCE

UI Developer / Backend Developer

Sep 2022 – Present

Inficloud Technologies — Telecom BSS / MVNO platform (Infimobile, Xmobee, Gorilla Wireless brands). Joined 26 September 2022 as Software Embedded Engineer following a Java entrance assessment.

Java · Spring Boot · Spring Data JPA · MySQL · RESTful APIs · Next.js · Angular · Node.js · Git · Jira

- Delivered a production change through the platform's **Java payment and wallet path**, replacing a hardcoded currency literal with a database-driven configuration lookup across the self-service payment controller, wallet accounts controller and reseller e-topup utilities — removing a compiled constant from customer-facing financial messaging.
- Primary consumer of **six Spring Boot services** (user management, wallet, payments, inventory, shipment, catalogue), working directly in their **RESTful API** contracts, request and response shapes, error semantics, and the platform's session-token and per-service API-key authentication model.
- Hardened **cross-application session and authentication handling**, reconciling conditional Session-ID and JWT header strategies and correcting session-cookie behaviour platform-wide.
- Implemented revenue-critical business logic end to end — **pricing, discount and tax computation** (value and percentage offers, per-month proration across contract tenure, add-on charges), dual payment-gateway integration (Stripe and Stax), and **bulk activation and bulk recharge** processing for reseller operators.
- Built telecom operations workflows against the BSS: **subscriber activation, mobile number portability (port-in and port-out), device swap, transfer orders, service requests**, and CDR/EDR reporting with dynamic aggregation over large datasets.
- Architected and own a **JSON-configuration-driven platform** on Next.js — component registry, declarative event routing, declarative API binding — rendering **four white-label brand and reseller sites from 458 configuration documents on a single codebase**, removing the need for per-brand forks. Top contributor: 510 of 2,270 commits.

removing the need for per-brand forks. Top contributor: 310 of 2,279 commits.

- Own a **metadata-driven Angular framework that ships 13 distinct products** from one codebase, including a declarative form and wizard engine with cross-field dependency resolution, and a server-paged table stack with role-scoped column visibility. Top contributor: 307 of 1,526 commits.
- Built the **release pipeline in Node.js** — AES-256-CBC configuration encryption, CSS compression and critical-CSS extraction, asset-path rewriting, environment proxy switching, deployable packaging — and an Express service backing the platform's visual editor.
- Ship into a codebase with no automated test coverage and no schema-migration tooling using explicit **blast-radius analysis** — enumerating callers, shared database tables, configuration keys and event consumers before editing — followed by staged verification. Agile delivery with Git branching, peer code review and Jira.

PROJECTS

Civil Engineering Marketplace — 16-service microservices platform

2026

Multi-tenant marketplace connecting customers with civil-engineering professionals — domain drawn from my civil engineering background.

Independent project, designed and built solo.

Java 21 · Spring Boot 3.2 · Spring Cloud 2023.0.1 · Spring Data JPA · OpenFeign · JWT · JUnit 5 · Testcontainers · Docker Compose · React 18 · Nginx

- Designed and implemented **16 independently deployable Spring Boot services** — authentication, user, tenant, project, booking, payment, notification, messaging, review, search, support, audit and admin — behind a **Spring Cloud Gateway**, with **Netflix Eureka service discovery** and a centralised **Config Server**. Approximately **31,000 lines of Java across 390 files**.
- Built a **payment service with escrow and milestone release**: wallet ledger, escrow holds governed by a status state machine, dispute resolution (release, refund or hold), Razorpay gateway integration and a scheduled auto-release job — with **185 explicit transaction boundaries** across the platform.
- Implemented **JWT authentication and role-based authorisation**, and **multi-tenancy** with per-tenant branding, onboarding and an administration console.
- Modelled **47 JPA entities** across 35 repositories using derived queries, JPQL and native SQL, exposing paginated APIs through **62 REST controllers** documented with OpenAPI / Swagger.
- Wired **15 OpenFeign clients** for inter-service communication; used Java records, Lombok and MapStruct throughout, with **constructor injection** as the standard pattern.
- Wrote **75 automated tests** — JUnit 5, Mockito, Spring Boot Test, and **Testcontainers** for integration coverage — and containerised the full stack with Docker Compose behind Nginx.
- Diagnosed and documented real distributed-systems defects during the build, including an API gateway truncating every proxied response, a CORS failure chain on the login path, and stale client state after authentication.

EDUCATION

B.Tech, Civil Engineering

2020

Malla Reddy Institute of Technology and Science, Hyderabad, Telangana

ADDITIONAL INFORMATION

- **Domain expertise:** Telecom BSS and MVNO operations — subscriber lifecycle, prepaid and postpaid billing, wallet and payments, CDR rating, mobile number portability, reseller channel management, carrier gateway integration.
- **Currently developing:** MS SQL Server query tuning and execution-plan analysis; distributed system design.
- **Availability:** Based in Hyderabad. Notice period **XX days** ; earliest joining date **date** .
